#### Abstract

Let $G=(V, E)$ be a graph with $p$ vertices and $q$ edges. $G$ is said to be Stolarsky-3 Mean graph if each vertex $\mathrm{x} \in \mathrm{V}$ is assigned distinct labels $\mathrm{f}(\mathrm{x})$ from $1,2, \ldots, \mathrm{q}+1$ and each edge $\mathrm{e}=\mathrm{uv}$ is assigned the distinct labels $\mathrm{f}(\mathrm{e}=\mathrm{uv})=\left\lceil\sqrt{\frac{f(u)^{2}+f(u) f(v)+f(v)^{2}}{3}}\right\rceil$ (or) $\left\lfloor\sqrt{\frac{f(u)^{2}+f(u) f(v)+f(v)^{2}}{3}}\right\rfloor$ then the resulting edge labels are distinct. In this case f is called a Stolarsky-3 Mean labeling of G and G is called a Stolarsky-3 Mean graph. In this paper we prove that $\operatorname{Path} P_{n}, \operatorname{Cycle} C_{n}, \operatorname{Comb} P_{n} \boldsymbol{\theta} k_{1}$, Ladder $L_{n}, S t a r ~ K_{1, n}$, Triangular Snake $T_{n}$, Quadrilateral Snake $Q_{n}$ are Stolarsky -3 Mean graphs.

Keywords: Graph Labeling, Mean Labeling, Stolarsky-3 Mean Labeling

## 1. Introduction

The graph $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ considered here will be finite, simple and undirected. We follow Gallian[1] for all detailed survey of graph labeling and we refer Harary[2] for all other standard terminologies and notations. S.Somasundaram and R.Ponraj introduced the concept of "Mean Labeling of Graphs" in 2004[3] and S.Somasundaram and S.S. Sandhya introduced the concept of "Harmonic Mean Labeling of graphs "in[4]. S.S. Sandhya, E.Ebin Raja Merely and S.Kavitha introduce a new type of Labeling called "Stolarsky-3 Mean

## Labeling of Graphs"

We will give the following definitions and other information's which are helpful for our present investigation.
Definition 1.1: A walk in which all the vertices $u_{1}, u_{2}, \ldots, u_{n}$ are distinct is called a path. It is denoted by $P_{n}$.
Definition 1.2: A closed path is called a cycle. A cycle on n vertices is denoted by $C_{n}$.
Definition 1.3: The graph obtained by adding a single pendant edge to each vertex of a path of $n$ vertices is called a comb. It is denoted by $P_{n} \boldsymbol{\Theta} K_{1}$.
Definition 1.4: The Cartesian product of two graphs $G_{1}=\left(V_{1}, E_{1}\right)$ and $G_{2}=\left(V_{2}, E_{2}\right)$ is a graph $G=(\mathrm{V}, \mathrm{E})$ with $\mathrm{V}=V_{1} \times V_{2}$ and two vertices $\mathrm{u}=\left(u_{1}, u_{2}\right)$ and $\mathrm{v}=\left(v_{1}, v_{2}\right)$ are adjacent in $G_{1} \times G_{2}$ whenever $\left(u_{1}=v_{1}\right.$ and $u_{2}$ is adjacent to $v_{2}$ ) or ( $u_{2}=v_{2}$ and $u_{1}$ is adjacent to $v_{1}$ ). It is denoted by $G_{1} \times G_{2}$.
Definition 1.5: The Ladder graph $L_{n}(\mathrm{n} \geq 2)$ is the product graph $P_{2} \times P_{n}$ which contains 2 n vertices and $3 \mathrm{n}-2$ edges.

Definition 1.6: A Triangular Snake $T_{n}$ is obtained from a path $u_{1}, u_{2}, \ldots, u_{n}$ by joining $u_{i}$ and $u_{i+1}$ to a new vertex $v_{i}$ for $1 \leq i \leq \mathrm{n}-1$. That is, every edge of a path is replaced by a triangle $C_{3}$.
Definition 1.7: A Quadrilateral snake $Q_{n}$ is obtained from a path $u_{1}, u_{2}, \ldots, u_{n}$ by joining $u_{i}$ and $u_{i+1}$ to two new vertices $v_{i}$ and $w_{i}$ respectively and then joining $v_{i}$ and $w_{i}$. That is, every edge of a path is replaced by a cycle $C_{4}$.
Definition 1.8: A bigraph (or a bipartite graph) is a graph whose vertex set V can be partitioned into two subsets $V_{1} \operatorname{and} V_{2}$ such that every edge of $G$ joins a vertex of $V_{1}$ to a vertex of $V_{2} .\left(V_{1}, V_{2}\right)$ is called a bipartition of G. If further G contains every vertex of $V_{1}$ is joining to all the vertices of $V_{2}$ then G is called a complete bigraph. It is denoted by $K_{m, n}$ where $\left|V_{1}\right|=m$ and $\left|V_{2}\right|=\mathrm{n}$.
Definition 1.9: A star is a complete bipartite graph $K_{1, n}$.

## 2. Main Results

Theorem 2.1: Any Path $P_{n}$ is a Stolarsky-3 Mean graph.
Proof: Let $u_{1}, u_{2}, \ldots, u_{n}$ be the vertices of the Path $P_{n}$ whose length is n .
Define a function $\mathbf{f}: \mathrm{V}\left(P_{n}\right) \rightarrow\{1,2, \ldots, \mathrm{q}+1\}$ by

$$
\mathbf{f}\left(u_{i}\right)=\mathrm{i}, 1 \leq i \leq n .
$$

Then the edges are labeled as

$$
\mathbf{f}\left(u_{i} u_{i+1}\right)=\mathrm{i}, 1 \leq i \leq n-1 .
$$

Thus we get distinct edge labels.
Hence Path $P_{n}$ is Stolarsky-3 Mean graph.
Example 2.2: The Stolarsky-3 Mean labeling of $P_{7}$ is given below.

Figure: 1
Theorem 2.3: Any Cycle $C_{n}$ is a Stolarsky-3 Mean graph.
Proof: Let $u_{1}, u_{2}, \ldots, u_{n}, u_{1}$ be the cycle $C_{n}$ whose length is n .
Define a function $\mathbf{f}: \mathrm{V}\left(C_{n}\right) \rightarrow\{1,2, \ldots, \mathrm{q}+1\}$ by

$$
\mathbf{f}\left(u_{i}\right)=\mathrm{i}, 1 \leq i \leq n .
$$

Then the edge labels are distinct.
Hence Cycle $C_{n}$ is Stolarsky-3 Mean graph.
Example 2.4: The Stolarsky-3 Mean labeling of $C_{8}$ is given below.

Figure: 2
Theorem 2.5: Comb $\left(P_{n} \boldsymbol{\Theta} K_{1}\right)$ is a Stolarsky-3 Mean graph.
Proof: Let $G$ be the Comb with vertices $u_{1}, u_{2}, \ldots, u_{n}$ and $v_{1}, v_{2}, \ldots, v_{n}$.
Let $P_{n}$ be the path $u_{1}, u_{2}, \ldots, u_{n}$ and join a vertex $u_{i}$ to $v_{i}, 1 \leq i \leq n$.
Define a function $\mathrm{f}: \mathrm{V}(G) \rightarrow\{1,2, \ldots, \mathrm{q}+1\}$ by

$$
\begin{gathered}
\mathbf{f}\left(u_{i}\right)=2 \mathrm{i}-1,1 \leq i \leq n . \\
\mathbf{f}\left(v_{i}\right)=2 \mathrm{i}, 1 \leq i \leq n .
\end{gathered}
$$

Then the edges are labeled as

$$
\begin{gathered}
\mathrm{f}\left(u_{i} u_{i+1}\right)=2 \text { i }, 1 \leq i \leq n-1 . \\
\mathrm{f}\left(u_{i} u_{i+1}\right)=2 \text { i }-1,1 \leq i \leq n .
\end{gathered}
$$

Thus we get distinct edge labels.
Hence Comb ( $P_{n} \boldsymbol{\Theta} K_{1}$ ) is a Stolarsky-3 Mean graph.
Example 2.6: Stolarsky-3 Mean Labeling of Comb obtained from $P_{5}$ is given below.

Figure:3
Theorem 2.7: The Ladder $L_{n}=P_{2} \times P_{n}$ is a Stolarsky-3 Mean graph.
Proof: Let G be the Ladder graph with the vertices $u_{1}, u_{2}, \ldots, u_{n}$ and $v_{1}, v_{2}, \ldots, v_{n}$.
Define a function $\mathbf{f}: \mathrm{V}(G) \rightarrow\{1,2, \ldots, \mathrm{q}+1\}$ by

$$
\begin{array}{r}
\mathbf{f}\left(u_{i}\right)=3 \mathrm{i}-2,1 \leq i \leq n . \\
\mathbf{f}\left(v_{i}\right)=3 \mathrm{i}-1,1 \leq i \leq n .
\end{array}
$$

Then the edges are labeled as

$$
\begin{aligned}
& \mathrm{f}\left(u_{i} u_{i+1}\right)=3 \mathrm{i}-1,1 \leq i \leq n-1 . \\
& \mathrm{f}\left(v_{i} v_{i+1}\right)=3 \mathrm{i}, 1 \leq i \leq n-1 .
\end{aligned}
$$

$$
\mathbf{f}\left(u_{i} v_{i}\right)=3 \mathrm{i}-2,1 \leq i \leq n
$$

Thus we get distinct edge labels.
Hence Ladder $L_{n}=P_{2} \times P_{n}$ is a Stolarsky-3 Mean graph
Example 2.8: The Stolarsky-3 Mean labeling of $\boldsymbol{L}_{\mathbf{5}}$ is given below.

Figure: 4
Theorem 2.9: Any Triangular Snake $T_{n}$ is a Stolarsky-3 Mean graph.
Proof: Let $T_{n}$ be the Triangular snake graph with the vertices $u_{1}, u_{2}, \ldots, u_{n}, v_{1}, v_{2}, \ldots, v_{n-1}$.
Consider a Path $u_{1}, u_{2}, \ldots, u_{n}$. Join $u_{i}$ and $u_{i+1}$ to new vertex $v_{i}, 1 \leq i \leq n-1$
Define a function $\mathbf{f}: \mathrm{V}\left(T_{n}\right) \rightarrow\{1,2, \ldots, \mathrm{q}+1\}$ by

$$
\begin{gathered}
\mathbf{f}\left(u_{i}\right)=3 \mathrm{i}-2,1 \leq i \leq n \\
\mathbf{f}\left(v_{i}\right)=3 \mathrm{i}-1,1 \leq i \leq n-1
\end{gathered}
$$

Then the edges are labeled as

$$
\begin{aligned}
& \mathbf{f}\left(u_{i} u_{i+1}\right)=3 \mathrm{i}-1,1 \leq i \leq n-1 . \\
& \mathbf{f}\left(u_{i} v_{i}\right)=3 \mathrm{i}-2,1 \leq i \leq n-1 . \\
& \mathrm{f}\left(v_{i} u_{i+1}\right)=3 \mathrm{i}, 1 \leq i \leq n-1 .
\end{aligned}
$$

Thus we get distinct edge labels.
Hence Triangular Snake graph $T_{n}$ is a Stolarsky-3 Mean graph.
Example 2.10: The Stolarsky-3 Mean labeling of $T_{6}$ is given below.

Figure: 5
Theorem 2.11: Any Quadrilateral Snake $Q_{n}$ is a Stolarsky-3 Mean graph.
Proof: Let $Q_{n}$ be the Quadrilateral Snake with the vertices $u_{1}, u_{2}, \ldots, u_{n}$,
$v_{1}, v_{2}, \ldots, v_{n-1}$ and $w_{1}, w_{2}, \ldots, w_{n-1}$. Consider a Path $u_{1}, u_{2}, \ldots, u_{n}$. Join $u_{i}$ and $u_{i+1}$
to two new vertices $v_{i}$, and $w_{i} 1 \leq i \leq n-1$.
Define a function $\mathbf{f}: \mathrm{V}\left(Q_{n}\right) \rightarrow\{1,2, \ldots, \mathrm{q}+1\}$ by

$$
\begin{aligned}
& \mathbf{f}\left(u_{i}\right)=4 \mathrm{i}-3,1 \leq i \leq n \\
& \mathbf{f}\left(v_{i}\right)=4 \mathrm{i}-2,1 \leq i \leq n-1 \\
& \mathbf{f}\left(w_{i}\right)=4 \mathrm{i}-1,1 \leq i \leq n-1
\end{aligned}
$$

Then the edges are labeled as

$$
\mathbf{f}\left(u_{i} u_{i+1}\right)=4 \mathrm{i}-1,1 \leq i \leq n-1
$$

$$
\begin{aligned}
& \mathbf{f}\left(u_{i} v_{i}\right)=4 \mathrm{i}-3,1 \leq i \leq n-1 \\
& \mathbf{f}\left(v_{i} u_{i+1}\right)=4 \mathrm{i}, 1 \leq i \leq n-1
\end{aligned}
$$

Thus we get distinct edge labels.
Hence Quadrilateral Snake $Q_{n}$ is a Stolarsky-3 Mean graph.
Example 2.12: Stolarsky-3 Mean labeling of $Q_{5}$ is given below.

Figure:6
Theorem 2.13: $K_{1, n}$ is a Stolarsky-3 Mean graph if $\mathrm{n} \leq 15$.
Proof: $K_{1,1}, K_{1,2}$ are Stolarsky- 3 Mean graphs.
Let the central vertex of the star be $u$. The other vertices are $v_{1}, v_{2}, \ldots, v_{n}$ respectively. Now we consider the following cases.
Case (i) $2<\boldsymbol{n} \leq 8$. Assign $u=1, v_{1}=2$ and $v_{i}=2 i-1,2 \leq i \leq 8$.
Then the labeling pattern is given below

Figure:7
Case (ii) $9 \leq \boldsymbol{n} \leq \mathbf{1 5}$. Assign $\mathrm{u}=1, v_{1}=2, v_{2}=3, v_{3}=4$ and $v_{i}=2 i-3,4 \leq i \leq 15$. Then the labeling pattern is given below.

$\mathrm{K}_{\mathbf{1 , 1 1}}$

Figure: 8
Clearly this labeling pattern is Stolarsky-3 Mean graph.
Case (iii) $\mathrm{n}>15$
Let the label of the vertices $\mathrm{u}=1, v_{1}=2, v_{2}=3, v_{3}=4, v_{i}=2 i-3,4 \leq i \leq n$

Figure:9

Here the edge labels of $\mathrm{u} v_{15}$ is 15 and $\mathrm{u} v_{16}$ is 17 . The number 16 missing which is not possible. From case (i), case(ii) and case(iii), we conclude that $K_{1, n}$ is a Stolarsky-3 Mean graph if $\mathrm{n} \leq 15$.

## 3. Conclusion

In this paper we introduced the concept of Stolarsky-3 Mean labeling and studied the stolarsky-3 Mean labeling behavior of some standard graphs. The authors are of the opinion that the study of Stolarsky-3 Mean labeling behavior of graph obtained from standard graphs using the graph operation shall be quite interesting and also will lead to new results.

## 4. Acknowledgements

The authors are thankful to the referee for their valuable comments and suggestions.
